PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 09/282,239	Applicant(s) GOLDMAN ET AL.	
	Examiner Richard G. Hutson	Art Unit 1652	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 18 December 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 25, 26 and 29-45 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 25, 26 and 29-45 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/18/2008 has been entered.

Applicant's amendment of claims 25, 26, 29, 30, 42-45, in the paper of 12/18/2008, is acknowledged. Claims 25, 26 and 29-45 remain at issue and are present for examination.

Applicants' arguments filed on 10/27/2008 and 12/18/2008, have been fully considered and are deemed to be persuasive to overcome some of the rejections previously applied. Rejections and/or objections not reiterated from previous office actions are hereby withdrawn.

Information Disclosure Statement

With regard to applicants information disclosure statement, it was previously communicated to applicants in the communication mailed on 11/14/2008, the information disclosure statement filed 10/27/2008 fails to comply with 37 CFR 1.97(c) because it lacks a statement as specified in 37 CFR 1.97(e). It has been placed in the application file, but the information referred to therein has not been considered.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 42-45 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Claims 42-45 are rejected under this statute because the recitation "...wherein 66.3 +/- 6.8% of cells in the enriched or purified preparation mature into oligodendrocytes when cultured in the presence of 5% FBS/IGF-1." is not supported by applicants specification at the time of filing and is thus considered new matter. Applicants presentation of applicants specification at page 21, lines 24-28 (Example 6) as support for "the 66.3 +/- 6.8% claim limitation" is acknowledged, however, while this

Art Unit: 1652

portion of applicants specification does recite that "... a matched sample of sorted cells stained after 3 weeks *in vitro* for O4 yielded 66.3 +/- 6.8% o4-IR cells, most of which co-labeled for the more mature marker galactocerebroside", it does not support applicants newly claimed genus the a enriched or purified preparation, wherein 66.3 +/- 6.8% of cells in the enriched or purified preparation mature into oligodendrocytes... It would appear at best the only association that can be made with respect to 66.3 +/- 6.8% is "O4-IR cells". Support for anything beyond such is considered new matter.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 25, 26 and 29-41 are rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Rao et al. (U.S. Patent No. 6,361,996 B1).

This rejection which was stated in the previous office action as it applied to claims 25, 26 and 29-41. In response to the rejection applicants have amended claims 25, 26, 29, 30, 42-45 and continue to traverse the rejection as it applies to the newly amended claims.

Art Unit: 1652

For applicants convenience the original rejection is repeated herein:

Rao et al. teach an isolated, pure (enriched or purified) and homogeneous population of lineage-restricted oligodendrocyte-astrocyte precursor cells which are capable of self-renewal and differentiation into oligodendrocytes and astrocytes and methods of generating, isolating and culturing such oligodendrocyte-astrocyte precursor cells. The specific pure homogeneous population of cells isolated by Rao et al. is illustrated in Figure 1 (See specifically cell type –14, and the supporting text) and while Rao et al. specifically teach as an example said pure (enriched or purified) homogeneous preparation of cells as isolated from rat, Rao et al. point out that the invention encompasses all mammalian neuroepithelial stem cells and is not limited to neuroepithelial stem cells from the rat. Mammalian neuroepithelial stem cells can be isolated from human and non-human primates, equines, canines, felines, bovines, porcines, ovines, lagomorphs, and the like. Thus, Rao et al. anticipates those claims to an enriched or purified preparation of human mitotic oligodendrocyte progenitor cells, the majority of which mature into oligodendrocytes, wherein an oligodendrocyte specific promoter (CNP2) is transcriptionally active in the oligodendrocyte progenitor cells.

The preparation taught by Rao is such that a cyclic nucleotide phosphodiesterase 2 promoter is inherently transcriptionally active in all cells of the enriched or purified preparation. This is evidenced by the reference Scherer et al. (Neuron Vol 12, pp 1363-1375, June 1994, see applicants IDS) who teach the differential cellular and temporal regulation of the 2',3'-cyclic nucleotide 3'-phosphodiesterase gene (CNP) and teach that the 2',3'-cyclic nucleotide 3'-

Art Unit: 1652

phosphodiesterase II promoter is transcriptionally active in oligodendrocytes, Schwann cells and many additional tissues and appears before the appearance of mature oligodendrocytes, in oligodendrocyte precursor cells early in brain development (See page1365-1367, Figures 4 and 5 and supporting text).

Claims 25, 26 and 30, which are drawn to the preparation of oligodendrocyte progenitor cells of claim 29 are included in this rejection because these product-by-process like limitations ("from a post-natal human" for claim 25 and "from an adult human" for claim 26, fetal human) do not change the oligodendrocyte progenitor cells of claim 29. Rao further teach that a better understanding of a number of tumors and other diseases in humans could be facilitated by a better understanding of these cell types and the ability to isolate and grow these mammalian cells in vitro, which allows for the possibility of using such stem cells to treat neurological disorders in mammals, particularly humans. Further, such mammalian neuroepithelial stem cells can be used therapeutically for treatment of certain diseases, e.g. Parkinson's Disease, such as by transplantation of such cells into an afflicted individual. Moreover, such cells can still further be used for the discovery of genes and drugs that are useful for treating certain of these diseases.

One of ordinary skill in the art at the time of filing would have been motivated to use the methods taught by Rao et al. to isolate an enriched or purified preparation of human mitotic oligodendrocyte progenitor cells from humans so that these pure cell preparations could be used to treat neurological disorders in humans, such as Parkinson's Disease, such as by transplantation of such cells into an afflicted individual.

Art Unit: 1652

This motivation is suggested by Rao et al. and the reasonable expectation of success comes from the results of Rao et al. who successfully isolated such an enriched or purified preparation of mitotic oligodendrocyte progenitor cells from rat.

It is noted that applicant's argument presented in the paper of 10/27/2008, is much like that presented by applicants in the paper of 3/14/2008.

Applicants continue to give applicants interpretation of the '996 patent and applicants submit the '996 patent discloses multipotential neuroepithelial stem cells and lineage-restricted astrocyte/oligodendrocyte precursor cells. In particular, applicants submit that after differentiation, in Example 14, the proportion of differentiated cells was 30% oligodendrocytes, 50% astrocytes, and 20% A2B5⁺ cells.

Applicants continue to submit that similarly, Example 15 of the '996 patent, the A2B5⁺ cells predominantly differentiate into cells with a type-2 astrocyte phenotype and this is entirely consistent with the previously submitted Second Declaration of Mahendra S. Rao, M.D., Ph.D. Under 37 C.F.R. § 1.132 ("Second Rao Declaration").

Applicants continue to submit that this bias of the '996 patent's astrocyte/oligodendrocyte progenitor to differentiate to astrocytes clearly distinguishes them from the presently claimed oligodendrocyte progenitor cells, the majority of which mature into oligodendrocytes.

Applicants continue to point out that it is important to note that multiple pathways to generate post-mitotic, mature oligodendrocytes, have been described and applicants again summarize these as they have previously done.

Applicants continue to focus on those comments of the previous Examiner's Answer which states that the previous claims are anticipated by Examples 7 and 15 of the '996 patent, as according to the PTO, these examples must produce an intermediate between the '996 patent's oligodendrocyte-astrocyte precursor cells and fully differentiated cells.

Applicants continue to submit that the PTO particularly relies on Example 7's mention of cells that appeared to have a different morphology than the oligodendrocyte type-2 astrocyte progenitors or mature oligodendrocytes in asserting anticipation. Applicants continue to disagree with this argument on two bases. Firstly, applicants continue to submit that these examples involve work with rat cells - not human cells. As previously, this response is recognized, however, not found persuasive on the basis that as previously stated, those claims drawn to the preparation of oligodendrocyte progenitor cells are included in this rejection because these product-by-process like limitations ("from a post-natal human" for claim 25 and "from an adult human" for claim 26) do not change the oligodendrocyte progenitor cells of claim 29. Further applicants are reminded that the current rejection is a 102/103 type rejection and while the origin of the cells taught by Rao et al. may be rat, applicants are reminded that one of skill in the art would be motivated to isolate the same cell population from human sources.

Secondly applicants continue to submit that the mention of cells having a morphology that is different than the oligodendrocyte type-2 astrocyte progenitors or mature oligodendrocytes does not mean that those additional cells are the claimed oligodendrocyte progenitor cells. Applicants submit that the PTO's point is entirely

Art Unit: 1652

speculative and is contrary to what Dr. Rao said in his second declaration and in taking this position, the previous Examiner's Answer is impermissibly ignoring the testimony of Dr. Rao who is in a far better position to know what cell types his work made and did not make. Applicants argument is again acknowledged, however, not found persuasive on the basis that as previously stated it is a reasonable and logical assertion that the cell type which is at the heart of applicants invention is an intermediate between the cell type 14 and 18 of Rao et al. and it must have existed in the preparations of Examples 15 and 7. Applicants have submitted that there is no evidence of such in the presentation of Dr. Rao's declaration, however, this is contrary to the teaching of Rao et al. as presented previously and below.

Applicants continue to submit that given Rao's clear teaching that his oligodendrocyte-astrocyte precursor cells have an astrocytic bias, it is not apparent how these cells can be regarded as the same as the claimed enriched or purified preparation from which a majority of the cells mature into oligodendrocytes. In any event, applicants submit that the claims have been amended to recite the conditions under which a majority of the cells in the enriched or purified preparation can mature into oligodendrocytes (i.e. cultured in 5% FBS/IGF-1). Since neither these conditions, let alone the result that a majority of the cells of the enriched or purified preparation mature into oligodendrocytes are taught by Rao, this reference can hardly be said to teach or render obvious the claimed invention.

Applicant's complete argument and amendment of the claims, continues to be acknowledged and has been carefully considered, however, continues to be found

Art Unit: 1652

nonpersuasive for the reasons previously made of record in the previous office actions and the previous examiners answer and for those reasons discussed above and below.

It continues that applicants have amended the claims to recite “an enriched or purified preparation of human mitotic oligodendrocyte progenitor cells, “wherein the majority of cells in the enriched or purified preparation mature into oligodendrocytes when cultured in the presence of 5% FBS/IGF-1...”

As previously stated if one considers that applicants claims are directed to an oligodendrocyte-specified progenitor cell which is “unipotential” such that it only gives rise to oligodendrocyte cells and not to other types of cells, such as astrocytes, then this “further specified oligodendrocyte-specified progenitor cell” continues to be anticipated by Rao et al. in its preparations of examples 15 and 7. As previously stated, in the previous office action, each of these example preparations start with NEP-derived A2B5+ cells and allow these progenitors to develop to oligodendrocytes. Thus, the NEP cells differentiated to cell type 14 (as per Figure 1) and further differentiated to cell type 18 (as per Figure 1). Thus an intermediate between the cell type 14 and 18 must have existed in the preparations of Examples 15 and 7.

Previously relative to this argument, applicants submitted that Dr. Rao is not aware of any evidence that the astrocyte/oligodendrocyte precursor cells of the '996 patent generated mature oligodendrocytes by way of an intermediate oligodendrocyte-specific precursor and applicants further presented Gregori et al., J Neurosci. 22(1):248-256 (2002) as suggesting that the '996 patent describes a glial progenitor that gives rise to a more restricted astrocyte/oligodendrocyte precursor that still directly makes

Art Unit: 1652

predominantly astrocytes and a small minority of oligodendrocytes. Thus, applicants submitted that cells in the '996 patent's pathway to oligodendrocyte production are bi-potential astrocyte/oligodendrocyte progenitor cells that have strong astrocytic bias. Applicants continue to submit that these cell types are very different from the claimed oligodendrocyte-specified progenitor cells of the present application.

As in the previous responses to this argument, if one considers that the claimed progenitor cell must be unipotential, such that it only differentiated into an oligodendrocyte cell, (that is an intermediate between cell type 14 and cell type 18) then contrary to the declaration of Dr. Rao, there is evidence of the existence of such a cell type. This evidence is found in Example 7 of the Rao et al. patent. Neither applicant's response of 10/27/2008 nor that of 12/18/2008 have addressed this previously made point.

As demonstrated in example 7 of Rao et al., NEP cells grown on fibronectin in NEP medium for 5 days according to the procedure of Example 1 were harvested by trypsinization and replated on laminin-coated plates in neuroepithelial culture (NEP) medium without the addition of CEE for 5-10 days. Differentiating NEP cells were then labeled, according to the procedure of Example 4, with markers previously identified as being expressed on oligodendrocytes and their precursors: A2B5, GalC, O1, and O4. Three days after replating NEP cells, a subset of the cells began to express A2B5 immunoreactivity. A2B5 immunoreactive cells initially did not express detectable levels of GalC, O4, and O1 immunoreactivity. These cells correspond to the Figure 1, cell type 14. After an additional three days in culture, however, "GalC immunoreactive cells

Art Unit: 1652

could be seen, which cells also expressed A2B5 immunoreactivity". Such cells appeared flattened and did not have the characteristic morphology of oligodendrocyte-type 2-astrocyte (O2A) progenitors or mature oligodendrocytes. Longer periods in culture, however, allowed more mature-looking oligodendrocytes with a small body and extensive processes to develop. These cells expressed O1 and GalC immunoreactivity, markers characteristic of differentiated oligodendrocytes. These cells which "appeared flattened and did not have the characteristic morphology of oligodendrocyte-type 2-astrocyte (O2A) progenitors or mature oligodendrocytes" are evidence of the existence of an intermediate between cell type 14 and cell type 18 of Figure 1. As stated by Rao et al., the pattern of antigen expression further suggests the existence of a dividing oligodendrocyte precursor that subsequently generates oligodendrocytes, as has been described from spinal cord cultures from older embryos. It is this identified cell type that continues to anticipate applicants claimed cells and applicants have not addressed this point made in the previous office action of 10/27/2008.

For these reasons, claims 25, 26 and 29-41 remain rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Rao et al. (U.S. Patent No. 6,361,996 B1).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Richard G. Hutson whose telephone number is 571-272-0930. The examiner can normally be reached on M-F, 7:00-4:00.

Art Unit: 1652

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nashaat T. Nashed can be reached on 571-272-0934. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
